

ABSTRACT

A firing mechanism for a firearm having a spring pressed firing pin comprises a sear engagable with the spring pressed firing pin in its cocked position and releasable by the sequential release of a cocking lever and a sear release lever through an abutting contact of a portion of the trigger element with the sear release lever. The initial and final positions of the trigger, as well as the spring bias imparted to the trigger, are readily adjustable, without disassembly. All adjustments of the trigger positions, and the spring force on the trigger, are readily adjustable by screws which are accessible through the between of two horizontally spaced trigger housing plates.
